

ABSTRACT OF THE DISCLOSURE

Conventionally, when due to running out of a battery or paper the printing designated in advance is not completed and when the interrupted printing is
5 to be resumed, the images from the beginning must be printed, or images to be printed must be selected again using the camera. To resolve this problem, a printing system, which continuously performs printing on a plurality of sheets based on print setting
10 information including, at the least, information for designating an image to be printed, comprises input means for entering image data that are to be printed printing means for printing the image data entered by the input means, storage means for, when printing
15 based on the print setting information is halted, storing interrupt information concerning the printing completed before the interrupt, and control means for employing the interrupt information stored in the storage means to resume printing based on the print
20 setting information.
